

MYNTRA SELENIUM REPORT

Prepared By : V Ajay Krishnan

1.Objective

The main objective is to verify the basic functionality of the Myntra website using Selenium and check whether user is able to search a product and filter the product.

The testing checks:

- Whether the homepage is launched successfully
- Whether the search functionality is working properly
- And user is able to filter the product

2.Environment & setup

Language Used: Java

Automation Tool: Selenium WebDriver

Testing Framework: JUnit 5

Build Tool: Maven

Browser: Chrome

OS: Windows

Base URL: <https://www.myntra.com/>

3. Framework design

The framework follows a Page Object Model (POM) structure:

- **BasePage:**
Contains reusable methods like click, find element, wait conditions, and navigation.
- **HomePage:**
Contains actions related to homepage such as opening the site and performing search.
- **ProductPage:**
Contains different product and filtering
- **Support Layer:**
 - Config → Reads base URL and configuration from environment
 - DriveFactory → Creates ChromeDriver instance with optional headless mode

- Test Layer:
Contains test execution logic using JUnit.

4. Project structure

- pages → Contains BasePage and HomePage classes
- support → Contains configuration and driver setup
- test → Contains test class for execution
- .env → Stores base URL and headless configuration

5. Test Execution Command

`mvn test`

6. STEPS PERFORMED

Test: FULL FLOW

1. Chrome browser is launched using DriverFactory
2. Myntra homepage is opened using base URL
3. Search bar is located
4. User enters T-Shirts in search bar
5. Enter key is pressed to perform search
6. Filter the product according to price and brand

7. Result

The test was executed successfully:

- Browser launched successfully
- Homepage loaded successfully
- Search action performed successfully
- Product was filtered successfully

8.Conclusion

The basic Selenium automation flow is working correctly.

The homepage navigation and search functionality were executed without issues. User was able to filter the products .

The framework uses Page Object Model, which helps in organizing code and improving reusability.
