

Week-04 Assessment Report

1. PactFlow Implementation

Implemented contract testing using PactFlow by configuring the Consumer and Provider projects. Created a PactFlow account, generated the Broker URL and API token, updated the Maven configuration, and modified the GitHub Actions workflows to integrate with PactFlow.

Activities Completed

- Created a PactFlow account and generated the Broker URL and API token.
- Configured the Consumer project to generate and publish Pact contracts.
- Configured the Provider project to verify contracts from PactFlow.
- Updated Consumer and Provider GitHub Actions workflows.
- Verified the PactFlow Broker URL and API token using PowerShell.
- Investigated publishing and provider verification issues using GitHub Actions logs.

Screenshots to Add

2. Selenide Automation Project

Developed a UI automation framework using Selenide with the Page Object Model (POM). The framework separates page classes from test classes, making the project modular, reusable, and easy to maintain.

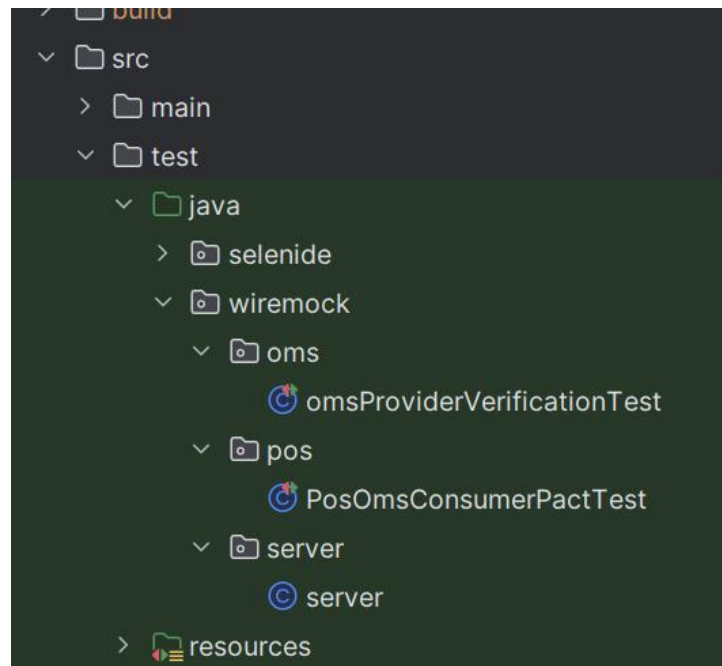

Figure: Selenide project structure

Framework Structure

- **pages package:** Contains Page Object classes such as CatalogPage, ProductPage, CartPage, CheckoutPage and OrdersPage.
- **tests package:** Contains FlowTest, which executes the complete end-to-end user journey.
- **resources:** Stores project configuration files such as simplelogger.properties.

End-to-End Test Flow

The automation validates a complete purchase flow:

1. **Open the Catalog page.**
2. **Select a product.**
3. **Add the product to the Cart.**
4. **Proceed to Checkout.**
5. **Place the order.**
6. **Navigate to the Orders page and verify that the order is displayed.**

Assertions Performed

Assertions are added throughout the flow to verify page navigation, product details, cart contents, checkout completion, and successful order creation. This ensures both functional correctness and end-to-end validation.

Current Status

- **PactFlow integration is configured and under verification.**
- **Selenide automation framework is implemented and the complete purchase flow is automated with assertions.**
