

API Automation Test Report

Practice Team Assessment

Purpose and details of document

The purpose of document is to document the objectives, environment setup, framework, test cases covered, results and conclusions of an API testing using rest assured.

Prepared By: Muhammed Ali M A

Date: 29-June-2026

Assessment: API Automation using Rest Assured

1. Objective & User Story

Objective

The objective of the Test Project is to validate a REST API functionality of the website using Rest Assured.

The automation test is used to test the scenarios that given in the assessment.

The automation test will be coded to be reusable, maintainable and easily understandable. For this POJO model must be followed. Instead of POJO we are using POJO with record in models instead of classes in models.

User story

As a QA Engineer, I want to retrieve a post and validate its details to ensure the API returns the expected data

Flow Under Test as Scenario

Question 1: Get Post

1. Send a GET request to: /posts/1
2. Validate:
 - a. Status Code = 200
 - b. id = 1

- c. userId is present
- d. title is not empty
- e. body is not empty

3. Environment & Setup

Test Details

Application URL - Configured through .env

Framework - Rest Assured, JUnit 5

Language - Java 22

Build Tool - Maven

Test Runner - JUnit 5

Schema Validation - JSON Schema Validator

OS - Windows 11

Environment Variables

Stored in: .env file

baseurl= (Enter the API URL of the website that testing)

Note: Here Dot Env package is used to get the env from file

How to run the test

1. Clone the repo with the project branch (git clone -branch BRANCHNAME --single-branch REPOSITORYLINK)
2. Go to the API testing directory (cd apitesting)
3. Run the execution commands according to the requirement

Execution Command

mvn test (To run the Whole Test)

mvn clean test (To run the Whole Test and Remove the previous tests results (the target file will get deleted))

mvn test -Dtest=ApiTest (To run the Api Test file only)

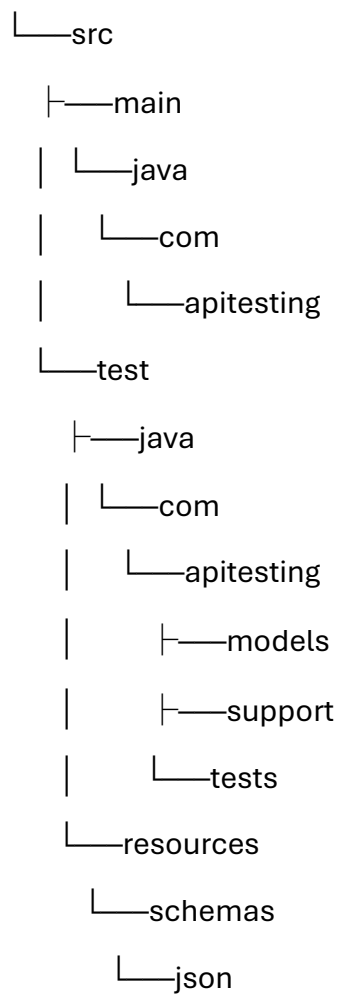

mvn test -Dtest=TESTCLASS# TESTMETHODNAME

(To run the TESTMETHODNAME inside TESTCLASS file only)

4. Framework Design

The framework we follow is POJO with record as model and we use Junit5 and rest assured.

Folder Structure

Directories and files in the framework

Tests Directory

Contains API test java files. Each Java file contains tests which covers the question.

File: ApiTest.java

Models

Contains Java Records which follows the POJO. Records will be used to pass in payload and to store the response.

Files: PostModel

Supports

Contains Java classes which supports the whole project . Supports contain utility classes for reusable methods and environment data handling, and Restassured ResponseSpecifications and RequestSpecifications.

File: Config,RequestSpec,ResponseSpec

Resources/Schemas

Contains schema files used for response validations.

File: post.schemas.json

5. Expectation

- a. Rest Assured
- b. Status code validation
- c. JSON Path
- d. Assertions

6. Results

TC_API_001 – Get post – Passed

7. Results Evidence

Test 1: Get Post

```
[INFO] Recompiling the module because of changed source code.

Schema:

```
{
  "$schema": "https://json-schema.org/draft-04/schema#",
  "type": "object",
  "required": ["id", "userId", "title"],
  "properties": {
    "userId": {"type": "integer", "minimum": 1},
    "id": {"type": "integer", "minimum": 1},
    "body": {"type": "string"},
    "title": {"type": "string", "minLength": 1}
  }
}
```

9. Conclusion

a. Rest Assured -- TRUE

b. Status code validation -- TRUE

c. JSON Path -- TRUE

d. Assertions -- TRUE

- Every test successfully executed and give Expected status.
- Successfully created the API testing using REST ASSURED, Junit and POJO.
