

UI Automation Assessment – Purple Website

Objective

Automate the product search and cart functionality on the Purple website using Selenium WebDriver and JUnit.

Automation Expectations

The automation solution should demonstrate the following:

- Dynamic locators
 - Iteration over the product list
 - Assertions on:
 - Page title
 - Cart count
-

Test Scenario

Scenario 1: Search Product

1. Launch the Purple website.
 2. Enter "lipstick" in the search box.
 3. Perform the search using the Enter key.
 4. Wait for the search results page to load.
 5. Verify that the search results are displayed successfully.
-

Scenario 2: Iterate Product List

1. Locate all product cards using a dynamic locator.
2. Iterate through the product list.
3. Extract each product title.
4. Store the titles in a list.
5. Print all product titles.

Example Dynamic Locator:

By.id("lp-itm")

This locator identifies all products whose id starts with lp-itm-, making the automation scalable.

Scenario 3: Add Product to Cart

1. Select a product from the search results.
 2. Click Add to Cart.
 3. Wait until the cart is updated.
-

Assertions

1. Page Title Validation

Verify that the page title matches the expected value after performing the search.

Example:

```
assertEquals("Expected Title", webDriver.getTitle());
```

2. Cart Count Validation

After adding a product to the cart:

- Verify that the cart count is updated.
- Expected cart count should be greater than zero (or equal to the number of products added).

Example:

```
assertEquals("1", cartCount.getText());
```

Dynamic Locator Strategy

Instead of using fixed product IDs like:

lp-itm-0

lp-itm-1

lp-itm-2

Use a dynamic locator:

```
By.cssSelector("[id^='lp-itm-']")
```

This approach automatically captures all products regardless of how many are displayed.

Product Iteration

Retrieve all product titles:

```
List<String> productTitles = new ArrayList<>();  
productTitles.add(firstTitle);  
productTitles.add(secondTitle);  
productTitles.add(thirdTitle);
```

Iterate through the list:

```
for (String title : productTitles) {  
    System.out.println("Product Title: " + title);  
}
```

This makes the automation reusable and scalable.

Click Interception Issue

Problem

While clicking the Add to Cart button, Selenium throws the following exception:

ElementClickInterceptedException:

element click intercepted:

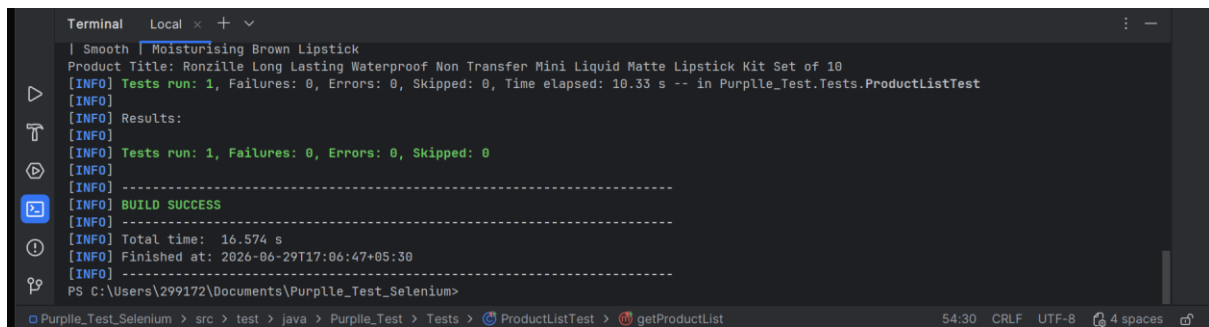

Element is not clickable at point (x, y)

This indicates that Selenium has located the element, but another element (such as a sticky header, loading overlay, popup, or banner) is covering it, preventing the click action.

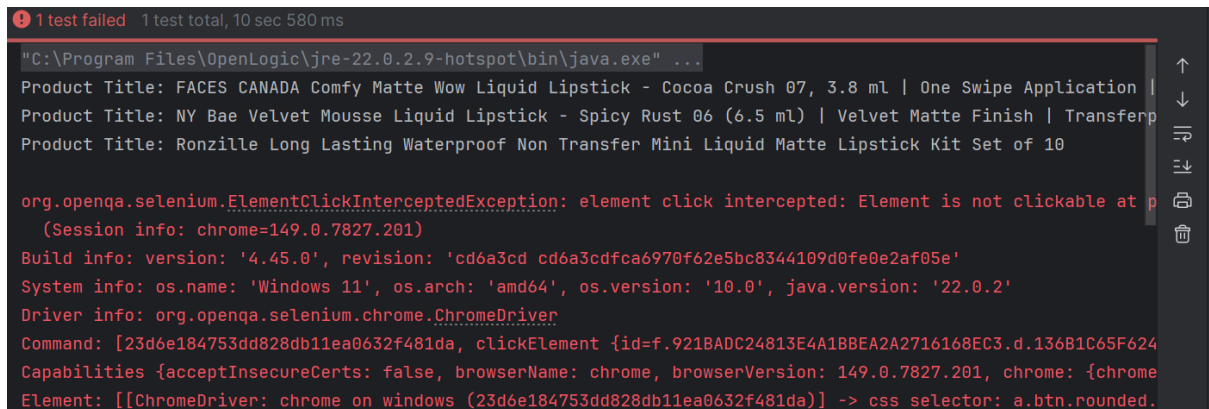

To Execute in the terminal:

Command: mvn clean test

Screenshot of Terminal Output:

```
Terminal Local x + v

```

Expected Outcome

The automation should successfully:

- Open the Purpille website.
- Search for a product.
- Display the search results.
- Dynamically identify all products.
- Iterate through the product list.
- Print product titles.
- Add a product to the cart.
- Verify the page title.
- Verify that the cart count updates correctly.
- Execute without ElementClickInterceptedException by using appropriate wait and click strategies.
